NEW CONSTRUCTION AT THE YUNG-TING MACHINERY PLANT (618 FACTORY) CHANG-HSIN-TIEN, CHINA DECLASSIFICATION REVIEW by NIMA/DOD 4/17/00 NATIONAL PHOTOGRAPHIC INTERPRETATION CENTER

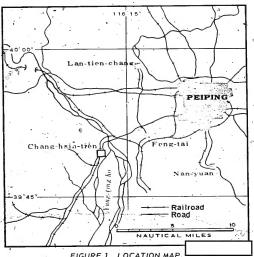

NEW CONSTRUCTION AT THE YUNG TING MACHINERY PLANT (618 FACTORY CHANG-HSIN-TIEN, CHINA

SUMMARY

A previously observed but hitherto unidentified installation located I nautical mile west-southwest of Chang-hsin-tien, China, and adjacent to the Peiping 1st Armored School, is identified as the Yung-ting Machinery Plant. This plant, which has the code designation 618 Factory, probably produces and/or repairs tracked armored vehicles and farm tractors; however, its proximity to the Peiping Rocket Engine Test Facility and the presence of a newly constructed section of the plant containing a large fabrication/assembly-type building suggest that the plant may be associated with the Chinese missile program.

INTRODUCTION

The Yung-ting Machinery Plant is located

at 39-49N 116-10E (Figure 1), approximately 1 nautical mile (nm) southwest of the town of Chang-hsin-tien, China, and approximately 1.5 nm east of the Peiping Rocket Engine Test Facility, Chang-hsin-tien The city of Peiping is approximately 9 nm northeast of the plant. Nearby installations (Figure 2) include the Peiping 1st Armored School, the Peiping Chang-hsin-tien Petroleum Product Storage, Kang Wa the Chang-hsin-tien Locomotive and Rolling Stock Plant the Military Barracks Area, Nan-ying; the Military Barracks and Depot, Chang-hsin-tien; a probable armored school; and 2 driver-training and vehicle test tracks. Also in the area is a reservoir which occupies a portion of the site of the abandoned Chang-hsin-tien Ammunition Depot (

An analysis of numerous collateral reports shows that the Yung-ting Machinery Plant is also known by the Chanese under the code designation 618 Factory and is located south of Changhisin-tien near an arting deschool and tank training area. The plant was formerly associated with the Chang-hsin-tien Locomotive and Rolling Stock Plant which continues to manufacture locomotives. The Yung-ting Machinery Plant is reported to repair armored vehicles and tanks, including the Soviet T-34, and to produce farm

YUNG-TING MACHINERY PLANT

The Yung-ting Machinery Plant is divided into 2 separately secured adjacent sections. The

older of the sections is adjacent to the northwest side of the Peiping 1st Armored School, Changhsin-tien (Figures 2, 3, and 4), and the newer section is immediately north-northwest of the older section. A narrow strip between the sections contains a diverted stream or ditch and also a road which connects a separately secured section of the 1st Armored School west of the the plant with a driver-training and vehicle test track east of the plant (Figure 4). The Chang-hsin-tien Locomotive and Rolling Stock Plant is immediately east of the test track, and on the western side of this plant (adjacent to the test track) is located an area of recent plant expansion (Figure 4).

THE OLDER SECTION OF THE PLANT

. The site occupied by the older section of the Yung-ting Machinery Plant was a barracks and 25X1D storage area when observed in Subsequently, the barracks and storage facilities were removed, and the older section of the machinery plant which was built on the site has shown al-25X1D most no change since first observed in One small support building was constructed in 25X1D and another was still under con-25X1D The layout of the area and dimensions of the major buildings are shown on Figure 4. The main production and/or repair facilities probably consist of 6 monitor-roofed shop buildings in the northern end of the section (Figure 3). Two of these buildings (items 7 and 8, Figure 4) are near a rail spur serving 4 on/ off loading and storage buildings. A rail-served steamplant is in the northernmost corner of the older section, and an apparently older heat and powerplant is in the western part of the section. Small support and storage buildings and ahousing and support area occupy the remainder of this older section.

THE NEWER SECTION OF THE PLANT

25X1D

The first photography to reveal activity at
the site of the newer section of the Yung-ting
Machinery Plant was obtained in when
only ground scarring and 1 building (item 3,
Figure 4) in an early stage of construction were
seen. The only previous photography was ob-
tained in and showed no activity at the site.
Although photography of was of
poor quality, the 3 main buildings of the plant
(items 2, 3, and 4) appeared complete, but con-
tinued ground scarring indicated that the newer
section of the plant was not operational at that
time. In the newer section contained
<pre>1 large multibay, monitor-roofed fabrication/</pre>
assembly building (item 2) with an adjacent
smokestack, 1 support building composed of
2 adjoining gable-roofed structures (item 3),
1 shop building having a single roof monitor
(item 4), and 1 small 2-levels structure (item
6). The probable transformer house (item 1)
at the site of the future substation in the north-
west extremity of the newer section appeared
to be in the early stages of construction. No
security was visible, and temporary access
roads converged from several directions.
Photography of showed
ditches for steamlines extending from a nearby
steamplant in the older section of the plant to
the new plant buildings. These ditches were later
filled and are no longer visible. By
the substation had been separately secured,
and a powerline was visible leading from the di-
rection of the large thermal powerplant at the
Peiping Rocket Engine Test Facility. Portions
of a security wall had been erected around the
plant, an interior road network was forming, and
a small building appeared just east of the shop building.
